

Residential Wiring (1 Semester)

This course will give the students a very good understanding of the field of Residential Wiring as the students will learn a great deal about circuit theory and wiring processes used in the building of houses. The students will learn how to safely and efficiently use the tools required of an electrician when it comes to wiring a house.

The students will complete wire diagramming and then actually go into the lab and build the various circuits as used in Residential Wiring. Hopefully some students will be encouraged to further their education and want to attend a technical college to study in a field related to Residential Wiring. The field of Industrial Maintenance changes on a daily basis and the need for people with skills in electricity is tremendous.

There is NO fee for this class.

Maximum Class Size: 16
